

TELEPHONE SET

Abstract of the Disclosure

A telephone set includes a housing and a dialing interface operably connected to a plurality of dialing keys. The telephone set is provided with a message alert and retrieval device comprising a message key that is operably connected to the dialing interface and a light source that causes emission of a visible light from the message key. The light source is responsive to a message waiting signal generated by a call management interface, and the dialing interface generates a message retrieval control signal in response to activation of the message key.
